CUSTODIAN ALIEN PROPERTY

PROCESS FOR MOTH-PROOFING

Heribert Schüssler, Cologne, Germany; vested in the Alien Property Custodian

No Drawing. Application filed July 29, 1941

The present invention relates to a process for protecting any kind of material being liable to the attack by moths and animal pests from the damage caused thereby.

My invention broadly consists in incorporating with the said material a cyclic organic compound containing a nucleus selected from the group consisting of the aromatic and heterocyclic nuclei, and in the said nucleus a substituent containing to be used according to my invention, the said substituent may contain one or more carbon atoms, and the carbon linkage may be interrupted by hetero atoms and/or groups of hetero atoms

Of the heterocyclic compounds, for instance as, for instance, O, S, SO₂, N, P and the like. 15 such of the triphenylmethane type may be men-Furthermore, the said compounds may be substituted in any desired way, for instance, by halogen, hydroxy, amino, sulfo, sulfoester, carboxylic acid, ether or thioether groups and the like; the compounds may also contain more than one 20 quaternary ammonium group. Besides, I have found such compounds to be particularly suitable for my process as owing to their higher molecular weight have a higher affinity for the material to be protected. Therefore, such compounds are 25 preferably used in my process which contain, as a substituent, an aliphatic radical of at least 6 carbon atoms.

Preferred compounds for use in the process of my invention may be obtained by causing di- 30 phenyl derivatives, such as 4-hydroxydiphenyl, to react with monochlorotriethylamine and then transforming the products with monochlorobenzyl chloride into the quaternary ammonium compounds. In this way a substance is obtained which is highly active against textile pests and which possesses an affinity for the fiber. Instead of the 4-hydroxydiphenyl also 4-aminodiphenyl may be caused to react with monochlorotriethylamine in the same manner and transformed as described above into the quaternary compound. The chlorotriethylamine may, for instance, also be replaced by 1.3-monochloropropylamine, and for the subsequent transformation into the quaternary ammonium compound also diethyl sulfate, dimethyl sulfate or other suitable alkylating agents may be used. Instead of monochlorobenzyl chloride also halogenides which are otherwise substituted may be employed.

It is also possible to use instead of diphenyl 50 derivatives, for instance derivatives of diphenylmethane, of triphenylmethane or heterocyclic compounds, as for example:

The condensation product of 1 mol of diethylamino-2'-hydroxy-3'.5'-dlehlorodiphenylmethane 55 mothproofing agents:

and monochlorotriethylamine, rendered quaternary with dimethyl sulfate.

The condensation product of 1 mol of 2.2'-dihydroxy-3.3'.5.5'.4''-pentachlorotriphenylmethane-5 2"-sulfonic acid sodium salt with 2 mols of monochlorotriethylamine, rendered quaternary dimethyl sulfate or dichlorobenzyl chloride.

The amides from substituted triphenylmethane sulfonic acids and substituted alkylene diamines a quaternary nitrogen atom. In the compounds 10 which are rendered quaternary on the amine nitrogen atom, as, for instance, an amide from Nmethyl-N'-dimethyl (ethyl)-ethylenediamine and rendered quaternary with dimethyl sulfate.

Of the heterocyclic compounds, for instance tioned, such as condensation products of isatin with substituted phenols, which compounds are caused to react with monochlorotrietlylamine on the nitrogen atom of the isatin and which are rendered quaternary on the amine nitrogen atom.

In a similar manner highly active products can be obtained by causing, for instance, monochlorotriethylamine to react with acid amides and by subsequently rendering quaternary. Also acid chlorides as such may be employed for the same purpose if they are caused to react with such diamines or polyamines as contain at least one N-atom which may be rendered quaternary.

Still another group of products to be used according to my invention are cyclic organic compounds of the general type: R.NIV wherein R is an aralkyl radical and NIV is a quaternary nitrogen atom. Particularly suitable are the aralkylammonium compounds substituted in the aryl radical and among these especially the halogen substituted aralkyl-ammonium compounds. Further, the ammonium compounds derived from alkyl diamines and among these in particular the mono-ammonium compounds which contain one or two aralkyl radicals of the benzene series attached to a tertiary nitrogen atom are particularly effective. If ammonium compounds are used which contain only one nitrogen atom it is advantageous to use such compounds as contain besides the aralkyl radical at least one alkyl radical with 6 or more carbon atoms. The ammonium compounds of the kind specified may be used in the form of the bases or in the form of the salts, in particular in form of mineral acid salts, for instance halides, particularly chlorides, bromides and fluorides, furthermore sulfates and sulfonates and others.

The following substances may be mentioned as

Benzyl - diethyl - dodecylammonium chloride, 3.4 - dichlorobenzyl - diethyl - dodecylammonium chloride, xylyl-pyridinium chloride, menaphthylpyridinium chloride, bis-(3.4.-dichlorobenzyl) nicotinium chloride, di - (3.4-dichlorobenzyl) aminoethyl-triethylammonium sulfethylate, (3.4dichlorobenzyl - methyl) - amino - ethyl - 3'.4' dichlorobenzyl-dimethylammonium sulfomethylate, dibenzyl - dimethyl-di-(3.4-dichlorobenzyl) trimethylene diammonium bromlde.

This series of suitable compounds may be continued at will, in particular on considering what is known about the suitability of the intermediate products as mothproofing agents. For, in the case of such compounds as already in the ab- 15 sence of a quaternary nitrogen atom display a certain protective action against moths, dermestidae and the like, and hinder the growth of bacteria, this protective action is further increased by introducing a quaternary nitrogen 20 atom. The products will then show a sufficient moth-proofing action even in very low concentration. Moreover, compounds of the kind described not only show an affinity for the animal fiber but also for the vegetable fiber and thus are 25 favorably distinguished from such known mothproofing agents as only take on the animal fiber. This property is of particular importance for the treatment of mixed animal and vegetable material, since it has been found that under certain conditions also vegetable fibers may be attacked by moths and other animal pests.

My present process may be used for protecting any kind of material being liable to the attack by moths, dermestidae, bacteria and like animal pests, the said materials comprising for instance textiles, paper, hides, leather, furs, feathers and the like.

My protective substances may be employed in aqueous solution and also in suitable organic 40 solvents. An especially good fixing of the protective substances is obtained by performing the treatment at higher temperatures, for example at boiling temperature. The treatment is preferably combined with one of the usual steps in 45 the treatment of fibrous materials. The treatment may thus take place, for example, during the dyeing or rinsing process, in the back-washing machine, during the finishing or greasing process, or also in French cleaning. Likewise, the solutions of the protective substance may be brought on the fiber by spraying or brushing on or in any way allowing of an even permeation of the material by the protective substance. In many cases it is of advantage to add the protective substance to the soap bath or to use soaps

without, however, restricting it thereto, the parts being by weight:

Example 1

Wool is treated by boiling for one hour in a dyelng apparatus in a bath of 1:20 with 0.5% of the amide of 3.5.3'.5'-tetrachloro-2.2'-dihydroxytriphenylmethane-2"-sulfonic acid and delta-(methyl-amino-pentyl) - diethyl-methyl - ammo-10 nium-sulfomethylate of the formula:

with the addition of 20% of sodium sulfate. The wool is thereby rendered moth-proof.

Mixed tissue of wool and artificial silk from regenerated cellulose is treated for one hour with 2% of the quaternary ammonium compound from 3.5.3'.5'.4''- pentachloro-2.2'- bis - diethylaminoethylether - triphenylmethane - 2"-sulfonic acid sodium salt and dimethyl sulfate of the formula:

in a bath of 1:30 at a temperature of 90-95° C. The goods are rendered immune from attack by moth larvae.

Example 3

Wool yarn is treated for one hour in a bath of 1:50 with 1.5% of the quaternary ammonium compound from 2.2'-diethylaminoethylether-3.3'dimethyl-5.5'.2''-trichlorotriphenylmethane and 2 mols of 3.4-dichlorobenzyl chloride of the formula:

provided with a content of protective substance. Furthermore, the present products may be used 70 of sodium sulfate. in admixture with each other and with other substances being suitable for combating animal pests like fluorine compounds, alkaloids and

others.

at a temperature of 90-95° C. and in the presence

Example 4

Staple fiber from regenerated cellulose is treated for 3 quarters of an hour at boiling tempera-The following examples illustrate my invention 75 ture with 0.5% of the quaternary ammonium 20

40

compound of 2.2'-diethylaminoethylether-5.5'dichloro-diphenyl-methane and 1 mol of 3.4dichlorobenzyl chloride of the formula:

The goods will not be attacked by moth larvae.

Example 5

The goods to be treated are immersed in or sprinkled with a 20% alcoholic solution of the quaternary ammonium compound of 2.4-diaminodiphenyl-2.4-dichlorobenzoyl chloride, monochlorotriethylamine and dimethyl sulfate probably of the formula:

The goods are rendered moth-proof.

Example 6

If to a paper pulp 2-3 grams per liter of the quaternary ammonium compound of 3-bis-(3'.5'dichloro -2'- hydroxyphenyl) -1- diethyl - aminoethyl-oxindol and para-chloro-benzyl chloride of the formula:

are added the paper produced therefrom is protected against paper pests, such as cockroaches and the like.

Example 7

Wool is treated by boiling for 3 quarters of an hour with 2% of the quaternary ammonium compound from methyl-2-chloro-4-(diethylamino- 75 three quarters of an hour at 30-40° C with a solu-

ethoxy)-diphenylmethane and 3.4-dichloro-benzyl chloride of the formula:

The goods are rendered moth-proof thereby.

Example 8

On treating wool by boiling with 1% of the monoquaternary ammonium compound from 1 mol of 2.4-diamidodiphenyl, 2 mols of monochlorotriethylamine and 1 mol of 3.4-dichlorobenzylchloride of the probable formula:

the goods are rendered moth-proof.

Example 9

Staple fiber is treated for one hour at 60-70° C with 1.5-2% of the quaternary compound from 4-diethylaminodiphenylmethane - 3'.5'- dichloro-2'-diethylaminoethyl ether and dimethyl sulfate of the formula:

$$\begin{array}{c|c} C_1\Pi_5 & C\Pi_2 \\ \hline \\ C_2\Pi_3 & C\Pi_2 \\ \hline \\ CH_2 & CH_2 \\ \hline \\ CH_2 & C_2\Pi_5 \\ \hline \\ C\Pi_2OSO_3O & C_2H_4 \\ \hline \end{array}$$

The goods are rendered immune from attack by 50 moth larvae,

Example 10

Mixed tissue of wool and artificial silk from regenerated cellulose is treated for 3 quarters of 55 an hour at 80° C with 1% of the amide of 3.5.3'.5'tetrachloro-2.2'-diacetoxytriphenylmethane-2''.sulfonic acid and beta-methylaminoethyltrimethylammonium sulfomethylate of the formula:

the goods are rendered moth-proof thereby.

Example 11

When treating feathers for half an hour or

10

15

tion of 6-8 grams per 1 liter of the quaternary ammonium compound being obtainable from 1 mol of 3.4.3'4'-bis(-dichlorophenoxy) phosphor sulfochloride, 1 mol of asymmetric diethylenediamine and 1 mol of 3.4-dichlorobenzyl chloride of the formula:

$$\begin{array}{c} Cl \\ Cl \\ Cl \\ Cl \\ Cl \\ \end{array} \begin{array}{c} S \\ C_2H_4 \\ C_2H_3 \\ Cl \\ \end{array} \begin{array}{c} Cl \\ Cl \\ \end{array} \begin{array}{c} C$$

the feathers are rendered immune from attack by moth larvae.

Example 12

Piece goods are treated on the washing ma- 20 chine in a bath of 1:30 with 3% xylyl-pyridinium chloride for 3 quarters of an hour at 40-50°C and finished in the usual manner. The goods treated in this manner are moth-proof.

Example 13

Wool is treated in a dyeing apparatus in a bath of 1:6 with 1.5% 3.4-dichlorobenzyl-diethyl-dohour at 75°C, centrifuged and dried. The wool 30 Thereby the fabric is rendered immune from atdecylammonium chloride for 3 quarters of an

Example 14

On adding to an olein spinning softener 10 grams of (3.4-dichlorobenzyl-methyl)-aminoethyl - 3'4' - dichlorobenzyl - dimethylammoniumsulfomethylate per liter the wool treated with the said softener is rendered moth-proof.

Example 15

If unspun wool on the backwashing machine is caused to flow in the last bath through a solution 8-10 grams of di-(3.4-dichlorobenzyl)-aminoethyl-triethylammonium-sulfomethylate the wool will not be attacked by moth.

Example 16

On treating wool-covers with a 2-3% solution of menaphthyl-pyridinium-chioride, for instance in chloroform, the wool-covers are protected against moth after the chloroform has evaporated.

Example 17

A woolen fabric is treated for half an hour to 3 quarters of an hour at 60°C in a bath of 1:30 with 1.5% of the reaction product of 3.4-dichlorobenzene sulfomonomethylamide and monochlorotriethylamine which has been transformed by the aid of 3.4-dichlorobenzyl chloride into the quaternary compound of the formula:

tack by moth larvae.

This application is a divisional of our application Ser. No. 161,752, filed August 31, 1937.

HERIBERT SCHÜSSLER.
